WATANABE, Mizuki  
(D Pharm Sc)

Proj Res\*\*  
JIN, Guihua  
(D Med Sc)

Proj Res\*\*,\*\*\*\*\*  
KUO, Ting-Fang  
(D Sc)

Guest Scholar\*\*\*  
SHEN, Yan  
(D Med Sc)

## Researchers

TAKEMOTO, Naohiro\*\*\*  
OTSUKA, Shinya\*\*\*

## Res Associates (pt)

ISHII, Kimiko\*\*\*  
NAKASHIMA, Mitsue\*\*\*

## Students

FRISCO, Heidie (D1)  
RYODEN, Yuta (M1)  
MAO, Di (RS)\*\*\*

\* Program-Specific Research Center  
Assist Prof of iCeMS  
\*\* PD (NEXT Program) of iCeMS  
\*\*\* iCeMS  
\*\*\*\* Res (WPI) of iCeMS  
\*\*\*\*\* PD (Global COE Program) of iCeMS

## Visitors

Prof WANG, Ming-Wei Chinese Academy of Sciences, China, P.R., 23 August  
Prof KIM, Sunghoon Seoul National University, Korea, R., 5 October  
Prof LEE, Kyeong Dongguk University, Korea, R, 28 November

## Scope of Research

Chemical biology is an interdisciplinary field of study that is often defined as “chemistry-initiated biology.” As biological processes all stem from chemical events, it should be possible to understand or manipulate biological events by using chemistry. Our laboratory has been discovering or designing unique organic molecules that modulate fundamental processes in human cells. Our mission is to create new world of bioactive synthetic molecules: their new way to use, their new shapes, and their new sizes. We hope to open new avenues for small-molecule applications in a range of fields, including future concepts in drug discovery and use of small molecules for cell therapy.

## A Mitochondrial Surface-specific Fluorescent Probe Activated by Bioconversion

We carried out cell-based image screening of 12,000 small molecules enriched in aromatic groups and identified thirty-one that had potential as fluorescent probes for living cells. One of the candidates appeared to selectively stain mitochondrial surfaces. Results of spectroscopic analyses and chemical synthesis indicated that the molecule underwent metabolic cyclization to be fluorescent inside cells. To our knowledge, this molecule represents the first fluorescent probe specific for mitochondrial surfaces.

## Cell-morphology Profiling of a Natural Product Library

Natural products provide a rich source of biological tools, but elucidating their molecular targets remains challenging. We carried out a cell morphological profiling of a natural product library, which permitted the identification of bisbromoamide and miuraenamides A as actin filament stabilizers. Automated high-content image analysis showed that these two structurally distinct marine natural products induce morphological changes in HeLa cells similar to those induced by known actin-stabilizing compounds. Bisbromoamide and miuraenamide A stabilized actin filaments in vitro, and fluorescein-conjugated bisbromoamide localized specifically to actin filaments in cells. Cell morphological profiling was also used to identify actin-stabilizing or -destabilizing natural products from marine sponge extracts, leading to the isolation of pectenotoxin-2 and lyngbyabellin C. Overall, the results demonstrate that high-content imaging of nuclei and cell shapes offers a sensitive and convenient method for detecting and isolating molecules that target actin.

## Discovery of FGH10019

In 2009, our group reported the discovery and synthesis of “fatostatin,” a small molecule that inhibits activation of sterol regulatory element-binding protein (SREBP). Fatostatin blocks biosynthesis and accumulation of fat in obese mice. We newly synthesized and evaluated a series of fatostatin derivatives. Our structure-activity relationships led to the identification of FGH10019 as the most potent drug-like molecule among the analogues tested. FGH10019 has high aqueous solubility and membrane permeability and may serve as a seed molecule for further development.

## Small-molecule Fluorescent Probes for Specific RNA Targets

A method was developed that uses small molecules as fluorescent probes to detect specific mRNAs. In this approach, the fluorescence of fluorophore-quencher conjugates is restored by the binding of an mRNA aptamer tag to the quencher segment of the molecules. The method allows real-time detection of mRNA transcripts in vitro.
